

Is It **Time to Test** the Quality of Your Well Water?

The Answer Is Almost Always, “Yes.”

The quality of well water can change at any time. A sudden thaw, a torrential downpour, a leaking septic tank—any of these can suddenly contaminate your water. That’s why testing your water is critical.

Point in time doesn't mean all the time.

Just because your water is good now doesn't mean it will be good tomorrow. You can't see, smell, or taste microorganisms, but that doesn't mean they aren't there and won't make you or your family sick. For that reason, public health authorities recommend well owners perform microbial and nitrate testing at least annually. After all, how can you fix a problem you don't know you have?

If you've never tested your water—or it's been a while—it's time to test. Give us a call today.
